

From registered evidence to a persistent engineering model

AstraBuild separates engineering problem formulation from numerical geometry: the model chooses or revises an operation, explicit tools execute and validate it, and accepted state becomes context for later reconstruction.

1 · PHYSICAL EVIDENCE + PRIOR STATE

MAIN LONGITUDINAL RESULT

The common loop persists, but the decision/operator portfolio broadens as dependencies accumulate:

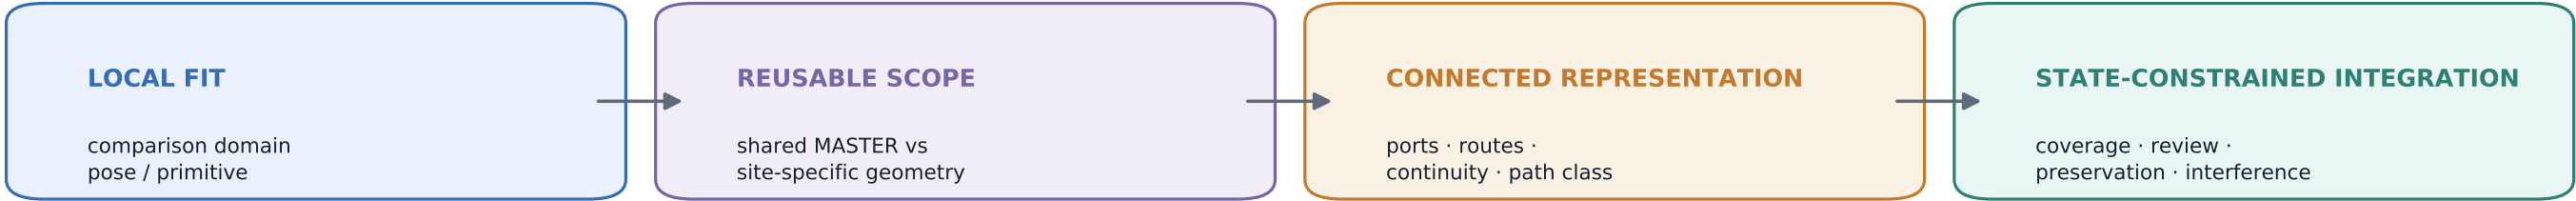

Figure 1. AstraBuild as a persistent evidence-program-validation workflow. Numerical geometry and acceptance remain explicit outside the language model; the paper studies how the operation selected around that backbone changes as the reconstructed scene acquires reusable, relational, and accumulated-state dependencies.
