

B01-B36: one sequential reconstruction record

Four descriptive target bands orient the chronology; eight anchor batches locate the decisions analyzed in the main text. The bands are not a common difficulty scale.

Orientation only: later tasks inherit accepted earlier state, so the chronology records a growing engineering world rather than 36 repeated trials of one fixed task.

Figure 2. Longitudinal study map. The eight anchors identify the evidence used to explain changes in comparison domains, reuse boundaries, connected representations, coverage-driven closure, and inherited-state integration.
