

From scene structure to inspection-addressable semantics

a D38.2/D40-equivalent artifact scale

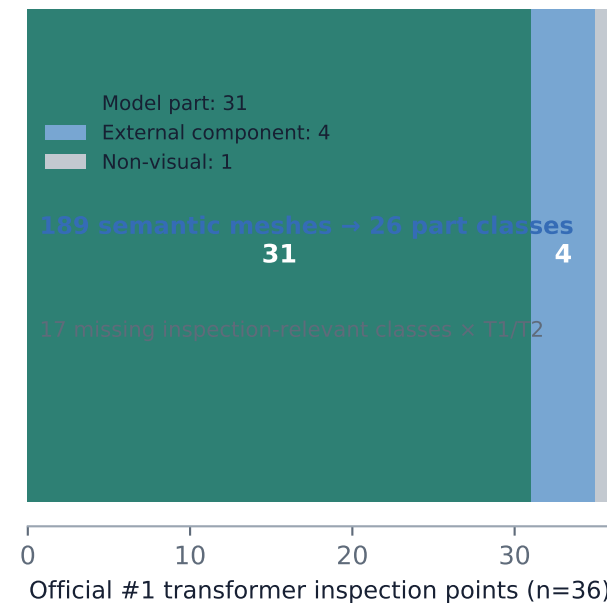

37,153 objects / 3,916 mesh datablocks $\approx 9.5\times$ descriptive reuse ratio.

b Device-level semantic attachment

Unmatched names remain explicit rather than being forced onto uncertain geometry.

c Transformer inspection-point categorization

Categorization coverage is not equivalent to complete station-wide part geometry.

Figure 4 · Geometry stabilization, explicit reuse, device mapping, and transformer inspection semantics are reported as distinct layers rather than a single accuracy number.
