

Quantitative evidence: agreement, validation screen, and omission coverage

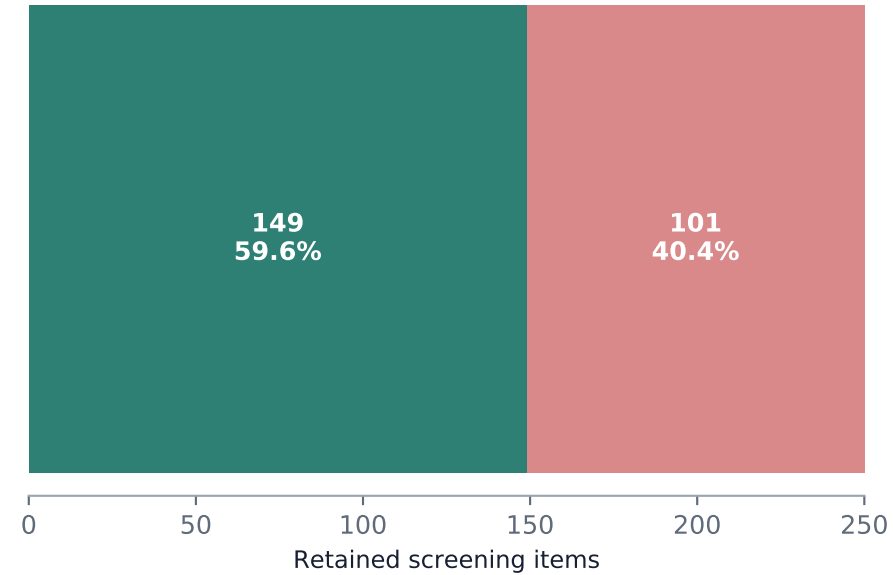

Each panel has a different interpretation; none is an independent survey-accuracy benchmark.

a Current coarse-reference residual ledger (n=1,550)

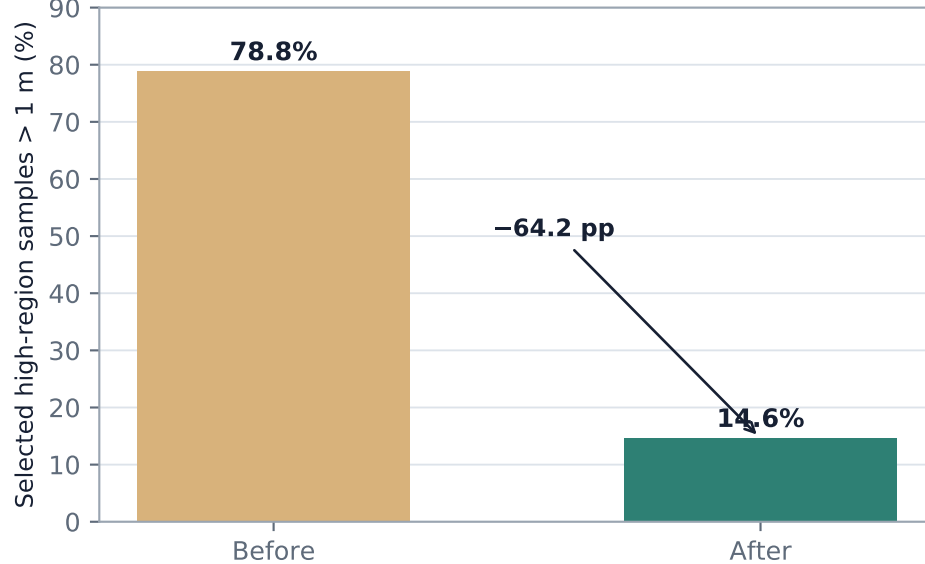

Same photogrammetric mesh is used as reconstruction reference and comparison surface.

b 5 cm validation-screen ledger

This is a retained validation screen, not a task success rate or overall model accuracy.

c Coverage-driven completion (B25/B26)

d Selected high-region median distance

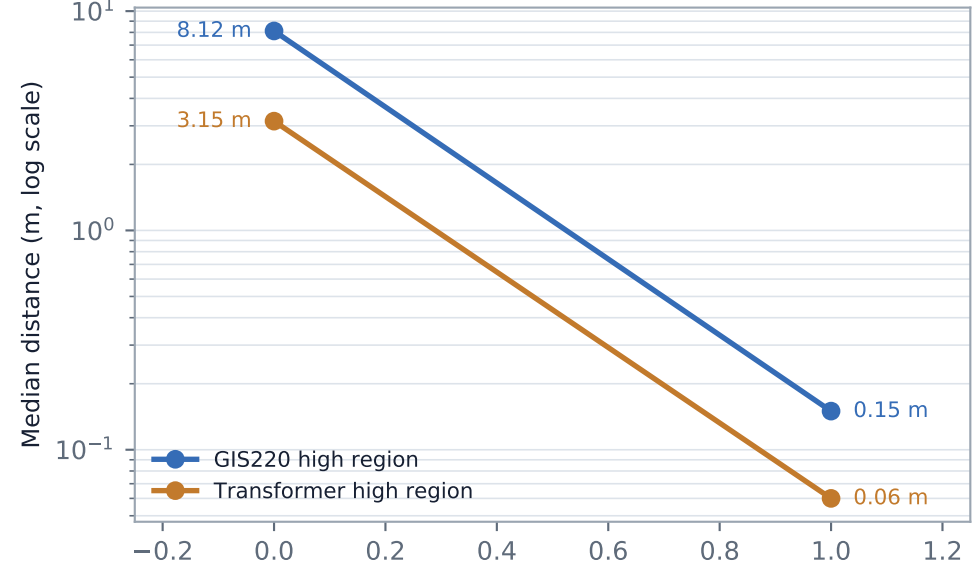

Figure 3 · Quantitative evidence uses separate metrics for local agreement and missing-geometry coverage. The 5 cm screen explicitly retains non-passing items.
